

Image Curation — Real Captures + Identity-Consistent Generated Visuals

Real screenshots for proof of work, a real photo for the person, generated visuals only for connective tissue — all matched to the content map and kept to one consistent style.

1 · IMAGE NEEDS VS. CONTENT MAP

Page	Image needed	Source	Status
Hero	Background texture behind the claim headline	AI-generated	Done
Work / Case Study	Real screenshots of the resume analyzer: score, extracted details, gaps checklist	Real capture	Done
About	A real photo of the person	Real capture	Done
Contact	Small icon reinforcing "evaluation" near the CTA	AI-generated	Done

2 · WORK / CASE STUDY — REAL CAPTURES (KEPT)

Chosen because together these three show the actual claim, not just the outcome: a score alone would read as a single API call, but the extracted-details breakdown and the gaps checklist show structured, multi-part judgment on messy input — closer to what "evaluate and produce structured judgment" actually means. Clean product-only captures, no browser chrome, legible at this size.

Note on the "Local backup" tag: the analysis shown was generated by a real LLM (Mistral API), not a rule-based fallback. The app's UI only checks for an OPENAI_API_KEY specifically, so using a Mistral key instead caused it to mislabel the result as "Local backup" even though a live model produced it. Worth fixing that label check in the code before this becomes a permanent portfolio asset, so the UI doesn't undersell what actually happened.

3 · ABOUT — REAL PHOTO (KEPT)

Standing photo, chosen over a close selfie-angle alternative

Cropped tighter from chest-up for portfolio use, framing and content otherwise unedited. Chosen over a second candidate photo (a closer, selfie-angle headshot) because the standing pose with arms crossed reads as more composed and intentional — the kind of frame someone chose for a professional context, not one grabbed mid-conversation. Real, unaltered photo; no AI involved.

4 · HERO TEXTURE — GENERATED, KEPT

Node network, even grid-jittered

Nodes and edges read as a reasoning graph — the actual shape of what an agent does, not decoration for its own sake. Even density across the width so a headline sits cleanly on top anywhere. Single orange node near center, matching the "accent used once" rule.

5 · CONNECTIVE ICONS — GENERATED, KEPT

Evaluate / judgment

Structured input → output

6 · REJECTED — AND WHY
